

It was very interesting to learn about Node.js this week. I've worked with web applications that have implemented Node.js in the past, but never really knew much about it as I was more of a front end designer. I was a little confused at first with how the example used a query object, but I think I've started to understand the example more after completing the homework. In the future I'd like to see if I can get JSON to work with Node, as I think that might be a little more useful or easier to manage than just writing to a plain text document. Overall I think just writing and editing a file on a server will be a very useful tool in the future.
